Exercise and Sport Science

Description of the major:
The exercise and sport science program provides students with a well-rounded background in the human movement sciences. Students acquire the knowledge, skills and abilities necessary to lead others in the area of health-enhancing physical activity and movement. The program's foundation courses in areas such as biology, anatomy, chemistry and physiology provide a scientific basis for human movement, while courses in areas such as biomechanics, exercise physiology, sport/exercise psychology, exercise testing and prescription, strength and conditioning, and motor behavior introduce students to the multidisciplinary study of movement.

The student experience:
• There is rapid growth in the fitness/wellness industry, sport sciences and allied health care professions. This growth creates a need for graduates with specialized training and a wide variety of exciting career opportunities.
• Students may focus their study to prepare for direct entry into the health/fitness industry (e.g., exercise physiologist, corporate fitness, personal trainer), for graduate/advanced study in the sport sciences (e.g., sport psychology, biomechanics, exercise physiology), or medical-related fields (e.g., physical therapy, occupational therapy, cardiac rehabilitation).

Beyond the classroom:
Graduates of the program move on to careers in the fitness industry, corporate wellness and physical rehabilitation, to name a few examples.
